

PROJECT MANAGEMENT ASISTANT

Hakan İREN – Selçuk ATAGÜN
Prof. Dr. Erdoğan DOĞDU

Çankaya University, Department of Computer Engineering

Abstract

The system architecture and software design are details of the description in this documentation. Project Management System is like preparing to the implementation. When we look at the Softare Requirement System, we seperated simple parts according to individual who enters the system. This part contributes to the Project that some of them has only its own pages. It can be made some changes, updates, deleting with helping a database. Database is useful for holding the all information about the Project Management System. So that, this documentation brings user information which has more reality and more visual. And also, it is a contribution for software.

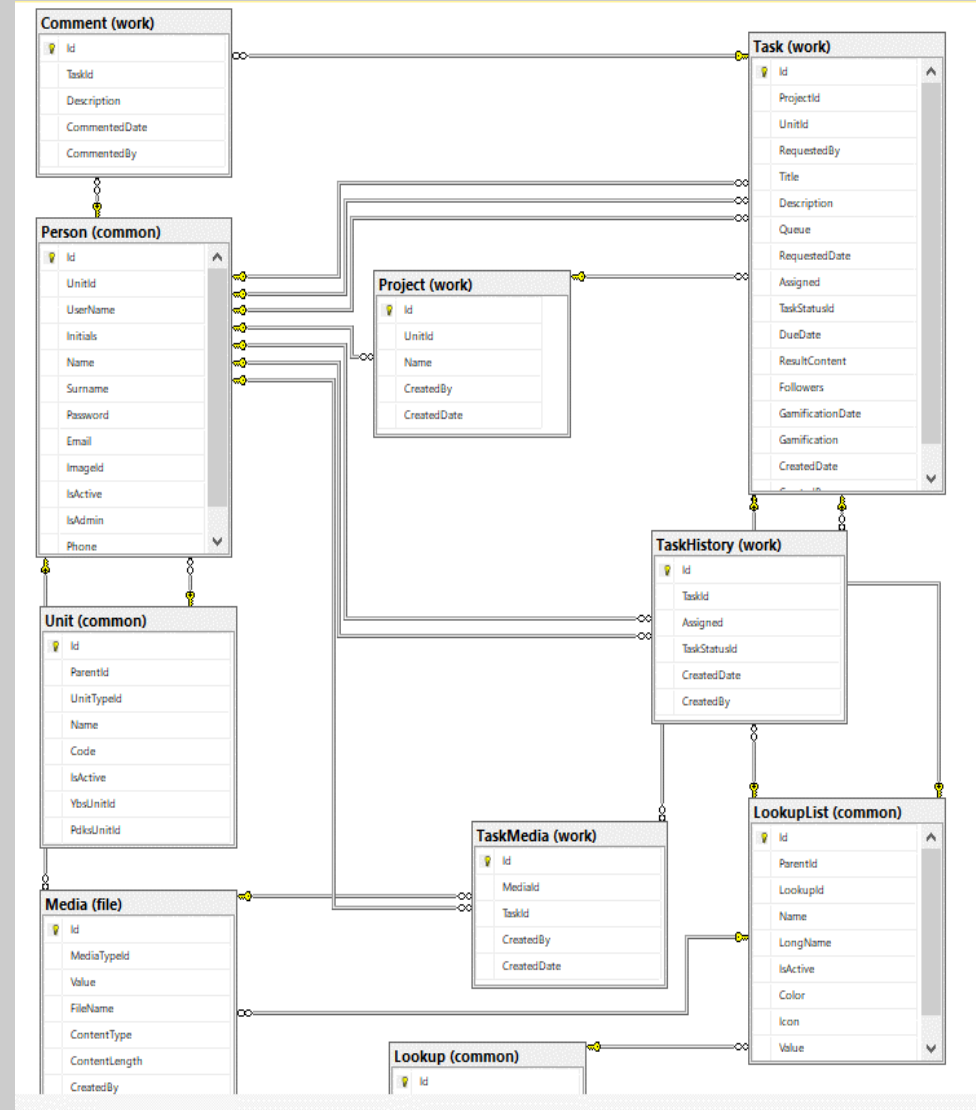

Figure 1 – Database

Introduction

This documentation is written to clarify the Project Management Asistant. The aim of this part includes to descriptions, functions, interfaces, and specific requirements. These mentioned titles are helpful for introducing the project.

Moreover, all explanatory information's addresses to development team members and customers of Project Management Assistant when progresses of the project.

Results & Conclusion

During this research, we learned a lot about the Project management assistant Systems. We tried to answer a lot of questions about what this system is, what it does, what are the benefits, what your web development technology and features are, and what applications are related to them. By the general structure of the system, we tried to give information about project and project cycle management concepts and phases, the phases of project development and planning within the scope of logical framework approach, and how to evaluate the project proposals using criteria. Finally, we tried to explain the basic concepts used in project management together

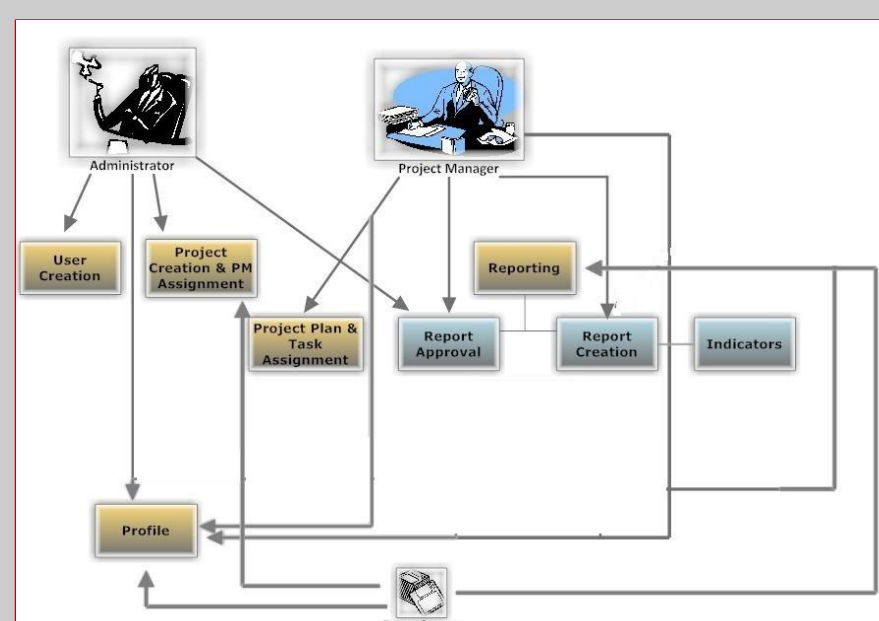

Figure 3 – System Overview

Solution

Project Management Assistant is a useful system for scheduling and management information systems, manufacturing, budgeting. It will be a guide for keeping essential information's about projects. There exists a project console to acquaint user with status of the project. This system provides user to enter stated information's about the project. Every project has important parts like that deadlines, task sequences, assign tasks, resources.

Moreover, calculations or modifies projects can be made easily. The user will be able to enter these subjects to the console. The mentioned system allows user to produce reports. It enhances communication between the project manager and the project team. To facilitate problem solving and project collaboration. This system will be made to use web technologies. And, users can easily follow the project which stated parts are made. Although the project is planned these contents, it does not provide leadership skills.

Acknowledgement

We would like to thank our advisor Prof. Dr. Erdoğan DOĞDU for his support and contribution on the Project. His expertise in computer science has helped us during developing process.
